Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

```
The invention relates to a novel CDNA gene encoding receptor protein 4-
1BB. The cDNA gene of the invention demonstrates immunostimulant
activities and may be useful as a probe to isolate DNA sequences encoding
for proteins similar to the receptor protein encoded by the DNA. The
protein, its fragments and derivatives may be useful as a probe to
isolate ligands to receptor protein 4-1BB, for stimulating proliferation
of B cells expressing 4-1BB ligands and for blocking 4-1BB ligand
binding. The antibody may be useful for enhancing T-cell proliferation or
activation. Finally, the invention may be useful with respect to cancer
research. The current sequence is that of the murine receptor 4-1BB
peptide (residues 105-115) of the invention.
                                                                                                                                                            receptor 4-1BB; immunostimulant; B-cell activation; T-cell proliferation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New cDNA gene encoding receptor protein 4-1BB, useful for isolating similar DNA sequences, and the encoded polypeptide and an antibody to it, useful for identifying ligands, and for modulating immune cell activity.
                                                                                                                           Murine receptor 4-1BB peptide - residues 105-115.
                                                                                                                                                                                                                                                                                                                                                                                                                         (ADRE-) ADVANCED RES & TECHNOLOGY INST.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure, Page 22, 77pp, English.

The present invention relates to a method for treating conditions leading to bone loss. The method comprises administering a purified and isolated to bone loss. The method comprises administering a purified and isolated osteoprotegerin (OPG) protein (AAF57836-AAF57838 and AAB66974-AAB66976) in conjunction with other substances such as tumour necrosis factor—alpha inhibitors, interleukin (IL)-6, -8 and -18 inhibitors, ICE modulators, fibroblast growth factor (FGF)1-10 modulators and/or platelet activating factor (PAF) antagonists. The method is useful for treating conditions leading to bone loss such as rheumatoid arthritis, multiple conditions leading to bone loss such as rheumatoid arthritis, multiple scalerosis, osteoporosis, osteomyelitis and asthma. The method is also useful for treating inflammation, systemic lupus erythematosus (SLE) and graft-versus-host disease (GvHD). Other diseases that can be treated include acute pancreatitis, Alzheimer's disease, anorexia, atherosclerosis, coronary conditions (e.g. myocardial infarction), cancer, diabetes, endometriosis, fever, glomerulonephritis, hyperalgesia, inflammatory bowel disease, ischaemia, pain, Parkinson's disease, bonnaries, commaniance of populary conditions (e.g. myocardial infarction) and septic shock. The present sequence was used in a sequence
                                                                                                                                                                                                                                                                                                                                                                                   Bone loss; osteoprotegerin; OPG; rheumatoid arthritis; hyperalgesia; multiple sclerosis; osteoporosis; osteomyelitis; asthma; inflammation; systemic lupus erythematosus; graft-versus-host disease; septic shock; acute pancreatitis; Alzheimer's disease; anorexia; atherosclerosis; pain; coronary condition; myocardial infarction; cancer; diabetes; psoriasis; endometriosis; fever; glomerulonephritis; inflammatory bowel disease; ischaemia; Parkinson's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The 4-1BB polypeptide (receptor) and the 4-1BB-L (cytokine, see AAQ75422) are useful in a pharmaceutical composition for stimulating the immune system. The 4-1BB and 4-1BB-L polypeptides are also useful for exploring mechanisms of T-cell activation, as they are expressed on T lymphocytes. 4-1BB-L can be used as a tissue culture reagent for in vitro cultivation of primary T-cells during the derivation of clonal T-cell lines. It may also be used to stimulate proliferation of activated T-cells, used in therapeutic procedures. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytokine, 4-1BB ligand (4-1BB-L) - binds to cell surface receptor 4-1BB to transduce signal.

                                                                                             Monoclonal antibody specific for human receptor protein 4-1BB - used to enhance proliferation and activation of T-cells for treatment of cancer and to inhibit specific ligand binding for treating auto:immune diseases.
                                                                                                                                                                                Novel murine receptor protein 4-1BB (AAW04173) has the potential to function as an accessory signaling molecule during T-cell activation and proliferation. It may represent a cell surface molecule involved in T-cell-APC interactions and may also act as a B-cell costimulator. It is structurally related to members of the nerve growth factor receptor superfamily. Its amino acid sequence was deduced from an isolated cDNA clone (see also AAT39541). A human homologue, H4-1BB (AAW04174), was identified and used to raise a monoclonal antibody useful in cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      4-1BB ligand; 4-1BB-L; receptor; mouse; cytokine; T lymphocyte; T cell; proliferation; immunostimulant.

This protein comprises mouse 4-1BB, a member of the tumour necrosis factor receptor superfamily that is expressed on helper, suppressor and cytolytic T cells, as well as on mouse brain tissue. A novel claimed cytokine, designated 4-1BB ligand (4-1BB-L) has been identified, cloned and sequenced (see AAW26656) that binds to murine 4-1BB. 4-1BB-L, especially its soluble extracellular domain, can be used to stimulate T-cell proliferation in vitro, as a research tool and as an affinity ligand for purifying 4-1BB. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mouse Receptor 4-1BB cDNA; Mouse Receptor 4-1BB protein; H4-1BB protein human 4-1BB protein; T cell activation; proliferation; immune response; receptor protein; autoimmune disease; organ transplantation; cancerous tumour; nerve growth factor receptor.

The present sequence is mouse 4-1BB receptor protein. This protein has 65% homology with human receptor protein 4-1BB. The protein has a putative leader sequence, a potential membrane anchor segment and other features of known receptor proteins. 4-1BB is structurally related to members of the nerve growth factor receptor. Probes derived from mouse 4-1BB cDNA are used to isolate cDNA of H4-1BB. The H4-1BB protein, its ligands, and various monoclonal antibodies have therapeutic uses. They may be used to enhance or suppress T cell activation and proliferation; for activation or inhibition of immune response; to block H4-1BB ligand binding; treating cancerous tumours and autoimmune diseases; and during Using human receptor protein 4-1BB ligands to, e.g. treat Diabetes Mellitus, Rheumatoid Arthritis and Systemic Lupus Erythematosus. Disclosure; Page 75; 86pp; English. organ transplantation

This invention describes a novel use of the human monocyte growth factor CD137, or its functional analogs, for (i) stimulating proliferation of peripheral monocytes; and (ii) treating diseases that are associated with disorders of a cellular system that includes monocytes (and/or their progression is treatable by stimulating proliferation of such cells. The products of the invention have antitumor, antibacterial, antivital, antifungal and immunostimulatory activity. Stimulating proliferation of monocytes promotes the non-specific immune response, i.e. it increases phagocytosis and intracellular destruction of microorganisms, immune complexes and damaged cells, and improves antibody (in) dependent cytotoxicity to tumor cells. CD137 is used, in vivo or ex vivo, to treat diseases associated with a defective immune response where caused by inadequate numbers of active monocytes/macrophages, especially damage to the hematopoietic system (leucopenia) caused by chemotherapy or radiation therapy; disorders of wound healing (e.g. in dialysis or diabetic patients, or those with chronic venous insufficiency); tumors; bacterial, fungal or viral infections; (non-)congenital or (non-)inherited diseases

fungal or viral infections; (non-) congenital or (non-) inherited diseases or injury to the immune system; injury induced by treatment with immunosuppressants (e.g. patients with chronic arthritis or autoimmune disease, or transplant patients). Nucleic acid encoding (I) can be used similarly, in gene therapy procedures. Proliferation of peripheral monocytes is achieved independently of hematopoietic stem cells. This sequence represents the murine CD137 protein described in the method of

The present sequence is the protein sequence of the murine cytokine receptor, 4-1BB. A portion of the extracellular (ligand binding) domain of the receptor was utilised in a murine 4-1BB/human 1gG1 Fc fusion protein, which was used to identify the murine 4-1BB ligand (4-1BB-L, see ABB75952). The invention provides novel murine and human 4-1BB-L polypeptides and human 4-1BB polypeptides, as well as DNA sequences encoding them, recombinant expression vectors and host cells, and methods for producing the novel polypeptides by cultivating the transformed host cells. Soluble forms of the 4-1BB-L and 4-1BB polypeptides, derived from their extracellular domains, have therapeutic value. Antibodies that are immunoreactive with 4-1BB-L or human 4-1BB are claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antibody specific for the cytokine 4-1BB-ligand, useful for immunoaffinity purification of the ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

L2G25B cDNA encodes lymphokine macrophage inflammatory protein 1 alpha (MIP-1alpha). Lymphokines are proteins by which the immune cells communicate with each other. Lymphokines are used therapeutically against immunologic diseases. Mouse lymphokine MIP-alpha can be used to modulate early myeloid progenitor cell differentiation. The present sequence is mouse lymphokine receptor 4-1BB protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated and purified cDNA designated L25G25B encoding the mouse lymphokine macrophage inflammatory protein 1 alpha which can be used for modulating early myeloid progenitor cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel cDNA gene encoding receptor protein 4-1BB. The cDNA gene of the invention demonstrates immunostimulant activities and may be useful as a probe to isolate DNA sequences encoding for proteins similar to the receptor protein encoded by the DNA. The protein, its fragments and derivatives may be useful as a probe to isolate ligands to receptor protein 4-1BB, for stimulating proliferation of B cells expressing 4-1BB ligands and for blocking 4-1BB ligand. binding. The antibody may be useful for enhancing T-cell proliferation or activation. Finally, the invention may be useful with respect to cancer research. The current sequence is that of the murine receptor 4-1BB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention describes a cDNA, which encodes for human receptor protein H4-1BB. The cDNA, or its fragments or derivatives, are useful as a probe to isolate DNA sequences encoding for proteins similar to the receptor protein H4-1BB, or its fragments or derivatives, is useful as a probe for identifying ligands to the receptor protein H4-1BB, or for stimulating the proliferation of B-cells expressing H4-1BB ligands. The monoclonal antibodies against H4-1BB are useful for enhancing T-cell proliferation of activation. The cDNA or receptor protein H4-1BB is also useful for blocking H4-1BB ligand binding, which is particularly useful for suppressing the immune system during transplantation, or for treating autoimmune diseases. This is the amino acid sequence of mouse receptor H4-1BB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New cDNA, or its encoded receptor protein H4-1BB, useful as probes to isolate DNAs or ligands to the receptor protein H4-1BB, or for blocking H4-1BB ligand binding to facilitate organ transplantation or treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mouse, lymphokine, L2G25B, macrophage inflammatory protein 1 alpha, MIP-1alpha; immune disease, myeloid progenitor cell differentiation;

The invention relates to a novel cDNA gene encoding receptor protein 4-1BB. The cDNA gene of the invention demonstrates immunostimulant activities and may be useful as a probe to isolate DNA sequences encoding for proteins similar to the receptor protein encoded by the DNA. The protein, its fragments and derivatives may be useful as a probe to isolate ligands to receptor protein 4-1BB, for stimulating proliferation of B cells expressing 4-1BB ligands and for blocking 4-1BB ligand binding. The antibody may be useful for enhancing T-cell proliferation or activation. Finally, the invention may be useful with respect to cancer research. The current sequence is that of the murine receptor 4-1BB peptide of the invention which contains residues 105-115.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New receptor inducible by lymphocyte activation - used to develop prods. for the diagnosis and treatment of inflammatory host defence pathology.
                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New cDNA gene encoding receptor protein 4-1BB, useful for isolating similar DNA sequences, and the encoded polypeptide and an antibody to it, useful for identifying ligands, and for modulating immune cell activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunostimulant; B-cell activation; T-cell proliferation;
                                                                                                                                                                                                                                                           The invention relates to an isolated and purified cDNA containing mouse lymphokine designated L2G25B. L2G25B cDNA encodes lymphokine macrophage inflammatory protein 1 alpha (MIP-1alpha). Lymphokines are proteins by which the immune cells communicate with each other. Lymphokines are used therapeutically against immunologic diseases. Mouse lymphokine MIP-alpha can be used to modulate early myeloid progenitor cell differentiation. The present sequence is mouse lymphokine receptor 4-1BB peptide
                                                                                                                                                                    New isolated and purified cDNA designated L25G25B encoding the mouse lymphokine macrophage inflammatory protein 1 alpha which can be used for modulating early myeloid progenitor cell differentiation.

This invention relates to an isolated nucleic acid molecule encoding a human tumour necrosis factor(TNF)-receptor related protein TR2. Included in the invention are the two splice variants of TR2, TR2-SV1 and TR2-SV2. The TR2 gene is located on chromosome I at position p36.2-p36.3. TR2 is a member of the TNFR superfamily. The invention includes a method for the treatment of arthritis or inflammation using an antibody directed against a fragment of the TR2 protein. TR2 its agonists, antagonists and antibodies exhibit cytostatic, dermatological, antianaemic, immunosuppressive, antiallergic, antiarthritic, antiasthmatic,
                                             ILA may be used to identify a host defence inflammatory response in body tissue. The ILA agents can be used to detect an ILA-mediated pathology such as atherosclerosis, autoimmune disease (rheumatoid arthritis, transplant rejection, pathogenic host defense responses to microorganism and mlignancy such as lung carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chromosome p36.2-p36.3; arthritis; inflammation; autoimmune disease; immunodeficiency; metastasis; haemolytic anaemia; asthma; X-linked SCID; severely combined immunodeficiency; apoptosis inhibition; Alzheimer's disease; Parkinson's disease; Crohn's disease.

antinflammatory, neuroprotective, nootropic, antiparkinsonian, and cerebroprotective activity. The methods are useful for treating arthritis or inflammation, cancer (such as follicular lymphomas, carcinoma with p53 mutations, cardiac tumours, pancreatic, breast, or prostate cancer), an autations, cardiac tumours, pancreatic, breast, or prostate cancer), an immunodeficiency or for enhancing an in vivo leukocyte response to an antigen. Anti-TR2 antibodies are useful for treating, inhibiting or preventing autoimmune diseases (such as autoimmune haemolytic anaemia, dermatitis, allergic encephalomyelitis, rheumatorid arthritis, asthma, and inflammatory myopathies) and immunodeficiency disorders (such as severely combined immunodeficiency disorders (such as severely combined immunodeficiency with Igs). TR2, TR2-SV1 and/or TR2-SV2 polymucleotides and polypeptides, agonists or antagonists are useful for treating or preventing autoimmune diseases and inhibit the growth, progression and/or metastasis of cancerous cells or inhibit the growth, progression and/or metastasis of cancerous cells or tissues, and can be used to treat diseases associated with increased cell survival, or the inhibition of apoptosis, e.g. Alzheimer's disease, or Parkinson's disease, or Crohn's disease. The TR2 polypeptides are useful as sources for generating antibodies, as molecular weight markers. This sequence represents the tumour necrosis factor receptor (TNFR) domain of the human 4-1BB protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Claim 1a; Fig 1A-B; 28pp; English.

```
The present sequence represents a novel human h4-1BBSV receptor. This is the tumour necrosis factor (TNF) family of ligands. It is induced by T-cell activation. The h4-1BBSV receptor nucleic acid and protein can be used for diagnosis and therapy. In particular, agonists of h4-1BBSV receptor can be used to treat and/or prevent tumours, restenosis, cytotoxicity, bacterial and viral infection, deleterious effects of ionising radiation, autoimmune disease, AIDS and graft-host rejection, to regulate immune responses, wound healing and cellular proliferation. Antagonists can be used to treat and/or prevent endotoxic shock, inflammation, cerebral malaria, activation of the HIV virus, graft rejection, bone resorption and cachexia
                                                                          Human 4-1BB receptor splicing variant and related DNA - used to develop products for treating e.g. tumours, viral infection, endotoxic chock, autoimmune disease or bone resorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   h4-1BBSV receptor; human; splice variant; antagonist; treatment; disease prevention; endotoxic shock; inflammation; cerebral malaria; HIV virus activation; graft rejection; bone resorption; cachexia;

This protein may be used to treat/prevent disease states mediated by h4-1BBSV receptors such as endotoxic shock, inflammation, cerebral malaria, activation of the HIV virus, graft rejection, bone resorption and cachexia. The h4-1BBSV coding sequences are useful in gene therapy. This sequence does not appear in the specification but has been created from the wild-type sequence
                                This sequence represents a novel human h4-1BBSV receptor protein which is used in a method for making a human 4-1BB receptor splice variant which acts as an antagonist. The antagonist polypeptides may be used to treat/prevent disease states mediated by h4-1BBSV receptors such as endotoxic shock, inflammation, cerebral malaria, activation of the HIV virus, graft rejection, bone resorption and cachexia. The h4-1BBSV coding sequences are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding human 4-1BB receptor splicing variant - useful in treating h4-1BBSV mediated disease states such as endotoxic shock, inflammation, graft rejection and inactivation of HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Location/Qualifiers

gene therapy. h4-1BBSV is useful for research, biological, clinical and therapeutic purposes. h4-1BBSV, its fragments, analogues or derivatives are useful as an immunogen to produce antibodies which are useful for isolating and identifying clones expressing the polypeptide or to purify the polypeptide. h4-1BBSV is useful for diagnosis and treatment of disorders of cells, tissues and organisms and its nucleic acid is useful for detecting complementary polynucleotides for e.g. as a diagnostic reagent and for chromosomal identification. h4-1BBSV receptor agonists are useful for preventing, treating tumours, restenosis, cytotoxicity, are useful for preventing, treating tumours, restenosis, cytotoxicity, and siseases, acquired immunodeficiency syndrome (ALDS) and graft-host rejection, to regulate immune responses, wound healing and cellular proliferation and antagonists are useful for treating and/or preventing endotoxic shock, inflammation, cerebral malaria, activation of human immunodeficiency virus (HIV) virus, bone resorption, graft rejection and cachexia. The present sequence is human h4-1BBSV receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; h4-1BBSV receptor; anti-tumour; virucide; immunosuppressive; anti-HIV; antibacterial; antiinflammatory; protozoacide; immunomodulator; vasotropic; gene therapy; chromosome mapping; extracellular domain; endotoxic shock; cytotoxicity; cerebral malaria; autoimmune disease; human immunodeficiency virus; HIV; graft-host rejection; bone resorption; cachexia; tumour; ionizing radiation; acquired immunodeficiency syndrome; AIDS; endothelial cell; proliferation; haematopoietic cell; restenosis;

Novel cDNA encoding human receptor protein H4-1BB - useful to produce the protein which is used to treat auto:immune disease and facilitate organ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human peripheral blood lymphocyte-derived cDNA was amplified by PCR using probes based on the mouse receptor protein 4-1BB gene. The PCR product was used to screen a cDNA library of activated human T-cells. The isolated cDNA (AAQ86126), deposited as NRRL AAB21131, encoded the human homolog, H4-1BB (AAR70977), of 4-1BB. (Updated on 25-MAR-2003 to correct
                                                                                  The 4-1BB polypeptide (receptor) and the 4-1BB-L (cytokine, see AAQ75423) are useful in a pharmaceutical composition for stimulating the immune system. The 4-1BB and 4-1BB-L polypeptides are also useful for exploring mechanisms of T-cell activation, as they are expressed on T lymphocytes. 4-1BB-L can be used as a tissue culture reagent for in vitro cultivation of primary T-cells during the derivation of clonal T-cell lines. It may also be used to stimulate proliferation of activated T-cells, used in therapeutic procedures. (Updated on 25-MAR-2003 to correct PN field.)
4-1BB ligand (4-1BB-L) - binds to cell surface receptor 4-1BB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          H4-1BB; receptor protein; immunosuppressive; autoimmune disease; organ transplantation; cell membrane ligand.
                                                                                                                                                                                                                                                                                                                      ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                 This invention describes a novel human h4-1BBSV receptor or a sequence that is at least 85% identical to the h4-1BBSV receptor. The product of the invention has anti-tumour, virucide, immunosuppressive, anti-HIV, antibacterial, antiinflammatory, protozoacide, immunomodulator and vasotropic activity and can be used for gene therapy and chromosome a disease related to underexpression of h4-1BBSV or for identifying agonists and antagonists. The soluble extracellular domain of h4-1BBSV receptor polypeptide is useful for treating and/or preventing endotoxic shock, cytotoxicity, inflammation, cerebral malaria, activation of human immunodeficiency virus (HIV), graft-host rejection, bone resorption or cachexia, tumours, autoimmune disease, ionizing radiation, acquired immunodeficiency syndrome (AIDS), for providing resistance to bacteria, viruses and parasites, to induce proliferation of endothelial cells and certain haematopoietic cells, to treat restenosis and to prevent certain autoimmune diseases after stimulation of h4-1BBSV receptor by an agonist.

This sequence represents the human 4-1BBSV receptor described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                 Novel isolated h4-1BBSV receptor polypeptide, useful for treating tumors, providing resistance to bacteria, viruses and parasites, to induce proliferation of endothelial cells, and to treat restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     T-cell; lymphocyte; activation; tissue culture; clone; cell lines; proliferation; stimulation; 4-1BB-L; ligand; receptor; cytokine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         function as an accessory signaling molecule during T-cell activation and proliferation. Its amino acid sequence was deduced from a cDNA clone (AAT39546) isolated from activated human T-lymphocytes. Recombinant H4-1BB can be produced in transfected host cells. It is used to isolate receptor ligands, to stimulate B-cells expressing such ligands and to block H4-1BB ligand binding. A fusion protein of H4-1BB with human placental alkaline phosphatase can be used to modify immune responses. A monoclonal antibody raised against an immunoepitope (see also AAW04172) of H4-1BB is useful in the treatment of cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monoclonal antibody specific for human receptor protein 4-1BB - used to enhance proliferation and activation of T-cells for treatment of cancer and to inhibit specific ligand binding for treating auto:immune diseases.

Its amino acid sequence was deduced from an isolated cDNA clone (see AAT91026) obtained from human peripheral blood T-lymphocytes. A novel claimed cytokine, designated 4-1BB ligand (4-1BB-L) has been identified, cloned and sequenced (see AAW26657) that binds to 4-1BB. 4-1BB-L, especially its soluble extracellular domain, can be used to stimulate T-cell proliferation in vitro, as a research tool and as an affinity ligand for purifying 4-1BB. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding 4-1BB ligand polypeptide(s) - useful for stimulating T-cell proliferation in vitro, and as research tools.

This invention describes a novel use of the human monocyte growth factor CC CD137, or its functional analogs, for (i) stimulating proliferation of peripheral monocytes; and (ii) treating diseases that are associated with disorders of a cellular system that includes monocytes (and/or their disorders of a cellular system that includes monocytes (and/or their cc derived cells, precursor or progenitors) or where the origin and/or products of the invention have antitumor, antibacterial, and/or cells invention have antitumor, antibacterial, antiviral, antifungal and immunostimulatory activity. Stimulating proliferation of antifungal and inmunostimulatory activity. Stimulating proliferation of complexes and damaged cells, and improves antibody (in) dependent complexes and damaged cells, and improves antibody (in) dependent cytotoxicity to tumor cells. CD137 is used, in vivo or ex vivo, to treat diseases associated with a defective immune response where caused by indequate numbers of active monocytes/macrophages, especially damage to the hematopoietic system (leucopenia) caused by chemotherapy or radiation therapy; disorders of wound healing (e.g. in dialysis or diabetic fungal or viral infections; (non-)congenital or (non-)inherited diseases or injury to the immune system; injury induced by treatment with immunosuppressants (e.g. patients with chronic venous insufficiency); tumors, bacterial, consultant, in gene therapy procedures. Proliferation of peripheral monocytes is achieved independently of hematopoietic stem cells. This enterior sequence represents the human CD137 protein described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of monocyte growth factor CD137 for stimulating proliferation of peripheral monocytes, particularly for treating immune deficiency, e.g. following cancer therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a human receptor protein 4-1BB. 4-1BB is structurally related to members of the nerve growth factor receptor. It contains a putative zinc finger structure similar to that of yeast e1F-2b protein. Probes derived from mouse 4-1BB cDNA are used to isolate cDNA of H4-1BB. The H4-1BB protein, its ligands, and various monoclonal antibodies have therapeutic uses. They may be used to enhance or suppress T cell activation and proliferation; B cell proliferation; treating cancerous tumours and AIDS. The use of H4-1BB to block H4-1BB ligand binding has practical application in the suppression of immune system during organ transplantation or against autoimmune diseases including diabetes, rheumatoid arthritis, and lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CD137; monocyte growth factor; proliferation; peripheral monocyte; treatment; disease; antitumor; antibacterial; antiviral; antifungal; immunostimulatory; non-specific immune response; phagocytosis; intracellular destruction; microorganism; immune complex; antibody; cytotoxicity; tumor cell; macrophage; hematopoietic system; leucopenia; chemotherapy; radiation; therapy; wound healing disorder; tumor; fungal;

The present invention relates to an isolated human 4-1BB receptor
splicing variant (h4-1BBSV, where 4-1BB is a member of tumour necrosis
factor (TNF) family of ligands) polypeptide. h4-1BBSV cDNA is used in
gene therapy. h4-1BBSV is useful for research, biological, clinical and
therapeutic purposes. h4-1BBSV, its fragments, analogues or derivatives
are useful as an immunogen to produce antibodies which are useful for
isolating and identifying clones expressing the polypeptide or to purify
the polypeptide. h4-1BBSV is useful for diagnosis and treatment of
disorders of cells, tissues and organisms and its nucleic acid is useful
for detecting complementary polynucleotides for e.g. as a diagnostic
reagent and for chromosomal identification. h4-1BBSV receptor agonists
are useful for preventing, treating tumours, restenosis, cytotoxicity,
care useful for preventing, treating tumours, estenosis, cytotoxicity,
autoimmune diseases, acquired immunodeficiency syndrome (AIDS) and graft-
host rejection, to regulate immune responses, wound healing and cellular
proliferation and antagonists are useful for treating and/or preventing
endotoxic shock, inflammation, cerebral malaria, activation of human
immunodeficiency virus (HIV) virus, bone resorption, graft rejection and
cachexia. The present sequence is human h4-1BB receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

The present invention describes the human TRID protein (tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without intracellular domain, also referred to as tumour necrosis factor receptor (TNFR-5 or TRS)). TRID has cytostatic, immunosuppressive, nootropic, neuroprotective, antiviral, anti-HIV, antiparkinsonian and vasotropic activities, and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins and polynucleotides are useful in the treatment of tumours, resistance to parasite, bacteria and viruses, restenosis and graft versus host disease. They are also useful for inducing proliferation of T-cells, endothelial colls and certain haematopoietic cells, to regulate antiviral responses and to prevent certain autoimmune diseases after stimulation of TRID by an agonist or TRAIL binding facilitator. The antibodies which bind TRID polymeptides are useful for treating and/or preventing diseases are useful in the diagnosis, treatment or prevention of: (a) cancer; (b) autoimmune diseases associated with increased or decreased apoptotic cell death. The TRID colymucleotides, proteins, antibodies, agonists and antagonists are useful in the disorders; (c) diseases associated with increased apoptotic autoimmune disorders; (c) with an advisable or decreased apoptotic or the present or decreased autoimmune disorders; (c) diseases associated with increased apoptotic autoimmune disorders; (d) wirelighted with increased apoptotic or decreased apoptotic or decreased apoptosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cardiovascular disorders; and (e) viral infection. The present sence represents a tumour necrosis factor receptor used in comparison
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô

The invention relates to an agonist or antagonist of MOCEPTIN (a member of the Tumour Necrosis Factor Receptor family) activity. The antagonist of the Tumour Necrosis Factor Receptor family) activity. The antagonist or agonist or antagonist, is useful for preventing or treating an obesity-related disorder or disease in an individual. In particular, the agonist of MOCEPTIN activity is useful for treating or preventing obesity-related diseases, e.g. hyperlipidemia, atherosclerosis, insulin resistance, clabetes, stroke or hypertension. The agonist is also useful for reducing body mass, or for treating or preventing disorders associated with excessive weight loss, e.g. cachexia, cancer-related weight loss, AIDS-related weight loss, chronic inflammatory disease-related weight loss, or anorexia. The present inflammatory disease-related weight loss, or anorexia. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New agonist and antagonist of MOCEPTIN (a member of the Tumor Necrosis Factor Receptor family) activity, useful for preventing or treating obesity-related diseases (e.g. hyperlipidemia or stroke), or increasing body mass.
                                                                                                                                                                                                                                                                 MOCEPTIN; tumour necrosis factor receptor; TNF receptor; anorectic; antilipemic; antiarteriosclerotic; antidiabetic; cerebroprotective; hypotensive; immunomodulator; antidepressant; human; receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1. .17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the protein sequence of the human cytokine receptor, 4-1BB. The sequence was deduced from a cDNA clone (see ABL54048) obtained from a human peripheral blood T-lymphocyte cDNA library. It shows 60% identity to murine 4-1BB (see ABB75954). A portion of the extracellular (ligand binding) domain of the human 4-1BB cytokine receptor was utilised in a human 4-1BB ligand (4-1BB-L, see which was used to identify the human 4-1BB ligand (4-1BB-L, see polypeptides and human 4-1BB polypeptides, as well as DNA sequences encoding them, recombinant expression vectors and host cells, and methods for producing the novel polypeptides by cultivating the transformed host cells. Soluble forms of the 4-1BB-L and 4-1BB polypeptides, derived from their extracellular domains, have therapeutic value. Antibodies that are immunoreactive with 4-1BB-L or human 4-1BB are claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibody specific for the cytokine 4-1BB-ligand, useful for immunoaffinity purification of the ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 47; DB 5; Length 255;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                       This invention describes a novel human h4-1BBSV receptor or a sequence that is at least 85% identical to the h4-1BBSV receptor. The product of the invention has anti-tumour, virucide, immunosuppressive, anti-HIV, antibacterial, antinflammatory, protozoacide, immunomodulator and vasotropic activity and can be used for gene therapy and chromosome adisease related to underexpression of h4-1BBSV or for identifying adisease related to underexpression of h4-1BBSV or for identifying adisease related to underexpression of h4-1BBSV or for identifying adjonists and antagonists. The soluble extracellular domain of h4-1BBSV receptor polypeptide is useful for treating and/or preventing endotoxic shock, cytotoxicity, inflammation, cerebral malaria, activation of human immunodeficiency virus (HIV), graft-host rejection, bone resorption or cachexia, tumours, autoimmune disease, ionizing resistance to bacteria, immunodeficiency syndrome (AIDS), for providing resistance to bacteria, certain haematopoletic cells, to treat restenosis and to prevent certain autoimmune diseases after stimulation of h4-1BBSV receptor by an agonist. This sequence represents the human 4-1BB receptor described in the
Novel isolated h4-1BBSV receptor polypeptide, useful for treating tumors, providing resistance to bacteria, viruses and parasites, to induce proliferation of endothelial cells, and to treat restenosis.

The invention relates to a method and apparatus for applying adhesive to packaging in a variety of configurations. The method involves applying adhesive on blank while moving in one direction, which is folded, and then another quantity of adhesive is applied before moving blank to another direction. The invention is useful for e.g. soap boxes, cereal boxes, bottle carriers, can boxes. The present sequence is human protein. Note: There is no specific information about the sequence in the
                                                                                                                                                                                                                                                                                                                                                                                                                                            Paper board container manufacture for soap boxes, involves applying adhesive on blank while moving in one direction, which is folded, and then another quantity of adhesive is applied before moving blank to another direction.

                                                                                                                                                                                                                                                                                                                                      New PRO polynucleotide and polypeptide, useful for the manufacture of a medicament for diagnosing or treating cancer or inflammatory bowel disorder e.g., ulcerative colitis or Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    for
                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises the amino acid and coding sequences of human proteins. The DNA and protein sequences of the invention are useful futhe diagnosis and treatment of cancer and inflammatory bowel disease (e.g. ulcerative colitis or Crohn's disease). The present amino acid sequence represents a human PRO protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Binding domain-immunoglobulin fusion protein-associated protein #77.
                       human; PRO; cancer; inflammatory bowel disease; ulcerative colitis; Crohn's disease.

comprising a binding domain polypeptide that is fused to an immunoglobulin have no comprising a binding domain polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide constant region polypeptide control in manupolobulin hinge region polypeptide. The fused for the first constant region polypeptide control in hinge region polypeptide derived from (a) having 30 rm core cysteine residues, hinge region polypeptide, derived from (a) having 30 rm core cysteine residues, where the first cysteine residues, where the first cysteine is not mutated, contains 2 cysteine residues, where the first cysteine is not mutated, and a mataced human igd1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues, where the first cysteine residues, in a mataced human igd1 immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin fusion protein is cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin hinge region protein is capable of a least one immunoglobulin hinge region protein contains no cysteine residues. The binding domain-immunoglobulin fusion protein, a recombinant expression construct, producing the bolymetected with a recombinant expression antignant contains of an expected of having a malignant condition or a promoter. The binding domain-immunoglobulin fusion protein and carrier, and treating a subject fusion protein or polymulation conquesting the binding domain-immunoglobulin fusion protein is useful for treating a construct, producing the binding domain-immunoglobulin fusion protein and a carrier, and treating domain-immunoglobulin fusion protein and a carrier and the polymulation of a binding domain-immunoglobulin fusion prote
                                                                                                                                                                                                                                                                                                                                                              New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a binding domain-immunoglobulin fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;

The invention describes a cDNA, which encodes for human receptor protein H4-1BB. The cDNA, or its fragments or derivatives, are useful as a probe to isolate DNA sequences encoding for proteins similar to the receptor protein H4-1BB, or its fragments or derivatives, is useful as a probe for identifying ligands to the receptor protein H4-1BB, or for stimulating the proliferation of B-cells expressing H4-1BB ligands. The monoclonal antibodies against H4-1BB are useful for enhancing T-cell proliferation of activation. The cDNA or receptor protein H4-1BB is also useful for blocking H4-1BB ligand binding, which is particularly useful for suppressing the immune system during transplantation, or for treating autoimmune diseases. This is the amino acid sequence of unknown human receptor H4-1BB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention relates to LP (LP318a, LP318b, LP288, LP289, LP343, LP319a, LP319b, LP319b, LP317, LP283, LP344, LP345 or LP346) proteins and LP319a, LP319b, LP321, LP317, LP283, LP344, LP345 or LP346) proteins and collaboration are polynucleotides encoding such proteins. Sequences of the invention are used to diagnose, treat or prevent cell proliferative disorders (e.g. actinic keratinosis, arteriosclerosis, psoriasis, leukaemia, lymphoma, actinic keratinosis, arteriosclerosis, autoimmune or inflammatory disorders (e.g. AIDS (acquired immune deficiency syndrome), Addison's disease, albergies, ankylosing spondylitis, amyloidosis, anaemia, asthma, acton, s disease, Goodpasture's syndrome, gout, Hashimoto's thyroiditis or Grave's disease, angina pectoris, myocardial infarction, atherosclerosis or hypertension), neurological disorders (e.g. stroke, Parkinson's disease or Alzheimer's disease) or developmental disorders (e.g. Down's syndrome or cerebral palsy). They are also used in gene therapy. The present sequence is human LP283 splice variant protein,
melanoma; cancer; inflammatory disorder; Addison's disease; allergy; acquired immune deficiency syndrome; AIDS; ankylosing spondylitis; amyloidosis; anaemia; asthma; Crohn's disease; Goodpasture's syndrome; gout; Grave's disease; Hashimoto's thyroiditis; cardiovascular disorder; congestive heart failure; ischaemic heart disease; myocardial infarction; angina pectoris; atherosclerosis; hypertension; neurological disorder; stroke; Parkinson's disease; Alzheimer's disease; developmental disorder; bown's syndrome; cerebral palsy; gene therapy; nephrotropic; nootropic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New mammalian LP polynucleotides and proteins, useful in gene therapy, e.g. for treating or preventing cancers, autoimmune (e.g. AIDS), cardiovascular (e.g. myocardial infarction) or neurological (e.g. stroke)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EH,

                                                                                                                                                                                                                                                        25-MAY-2001
```

The sequence represents an angiotensin converting enzyme splice variant of (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal colypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis, immune disorders such as immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidotic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial

WPI; 2002-017601/02. N-PSDB; ABA03875. New isolated polypeptides for treating a broad range of pathological states, e.g., depression, stroke, Parkinson's disease, Huntington's disease, Tourette's syndrome, amyotrophic lateral sclerosis, head trauma, and Alzheimer's.

Claim 1; Page 33-34; 155pp; English.

The present invention describes polypeptides (I), designated POLYX

CD polypeptides (e.g. POLY1.4 are members of the gamma aminobutyric acid

(II) encoding them. POLY1-4 are members of the gamma aminobutyric acid

(GABA) receptor family; POLY5-11 are members of the epidermal growth

CC factor (BGF) family; POLY3-11 are members of the complement receptor

CA family; POLY12 is a member of the haematopoietic stem and progenitor cell

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the sulphotransferase family; POLY14

(HSPC) family; POLY13 is a member of the cerebroyncective, antialcoholic, cardiant, tranquilliser and medicament for treating a syndrome as a therapeutic in the mammal, especially patients suffering from, e.g., pathological state in a mammal, especially patients suffering from, e.g., pathological state in a mammal, especially patients suffering from, e.g., psychiatric and medical conditions, depression, stroke, Parxinson's clesses, Huntington's disease, Tourette's syndrome, amyotrophic lateral scale anxiety, muscle tension, epileptogenic activity and memory functions, correctly muscle tension, epileptogenic activity and memory functions, correctly and arrhythmogenic right ventricular dysplasia. ```

The invention describes an isolated POLYX (POLY1-17) polypeptide and its variant. POLYX polypeptides (especially POLY5, POLY6 and POLY7), the polynucleotides encoding them (I) and an anti-POLYX-antibody (III) are

Claim 1; Page 20-21; 91pp; English.

cc useful for treating or preventing a pathology associated with POLYX clisease. POLYX polypeptide is also useful for identifying an agent that chinds to POLYX and a cell expressing POLYX is useful for identifying a cc binds to POLYX and a cell expressing POLYX is useful for identifying a cc therapeutic agent for use in treatment of a pathology related to aberrant cc expression or physiological interactions of the polypeptide. (III) is useful for treatment of POLYX in a sample. POLYI—4 (GABA receptor—like to proteins) are useful for the treatment of psychiatric and medical conditions, depresesion, stroke, Parkinson's disease, Huntington's conditions, appresession, stroke, Parkinson's disease, Huntington's conditions, depresession, amyotrophic lateral sclerosis, head trauma, altaheimer's disease, alcoholism, vigicalnee, anxiety, muscle tension, conditions and memory functions, cardiomyopathy and arrhythmogenic activity and memory functions, cardiomyopathy and arrhythmogenic right ventricular dysplasia. POLY5-8 (Epidermal growth factor like proteins) may be useful for treating carrant carnythmosensis, renal disease and diabetes. POLY12 (haematopoietic stem and grogenesis, renal disease and diabetes. POLY12 (haematopoietic stem and creating cirrhosis, cholangitis, hepatitis, ulcers, hyperthyroidism and developmental disorders. POLY1-16 (Syntaxin-like proteins) may be useful for treatment of Lambert-Eaton mysathenic syndrome, asthma, myxoid liposarcoma and acute myeloid leukaemia, and POLY 18 may be useful in treatment of Lambert-Eaton mysathenic syndrome, asthma, myxoid liposarcoma and acute myeloid leukaemia, and POLY 18 may be useful in treatment of Lambert-Eaton mysathenic syndrome, sethma, myxoid liposarcoma and caute myeloid leukaemia, and POLY 18 may be useful in treatment of Lambert-Eaton mysathenic syndrome, sethman myzotein and for identifying and/or ectivity of POLYX protein and for identifying and, or evaluating a novel human protein activity. This is the amino acid sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Seq

Application US/08795446B

Sequence 52. Application US/0879546B

Patent No. 6288032

GENERAL INFORMATION:

APPLICANT: Boyle, Willaim J.

APPLICANT: Calzone, Frank J.

APPLICANT: Chang, Ming-Shi

TITLE OF INVENTION: OSTEOPROTEGERIN

NUMBER OF SEQUENCES: 53

CORRESPONDENCE ADDRESS:

ADDRESSEE: Amgen Inc.

STREET: 1840 Dehavilland Drive

CITY: Thousand Oaks

STRATE: California

COUNTRY: USA

ZIP: 91320-1789

COMPUTER: READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: TBM PC Compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #1.0, Version #1.30

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/795,446B
